

Wax Melter Instructions for Candle Making

Thank you for ordering our wax melter. If there are any issues with the wax melter, please contact us at: eric@diygateway.com

The wax melter comes with the below parts: Wax melter pot & spout, 4 legs, 2 handles, Lid, Thermostat dial, Magnetic electrical cord.

Safety Precautions:

- Do not touch the spout or the metal pot while on.
- Never exceed 250 f for melting wax
- Never leave wax or pot unattended.
- Unplug when not in use.
- Always wear protective gloves, safety goggles and skin protection to avoid burning your skin.
- Never let a minor use the melter without supervision.
- DIY Gateway takes no responsibility for the misuse of this product. Please use at your own risk.

Assembly

Assemble the feet and handle using a screwdriver.

Insert the thermostat dial with its probe into the side of the pot. Then line up the electrical cord on the side of the thermostat so the magnet connects it together. It is made this way as a safety measure to easily disconnect in the case the cord is pulled or tripped over.

Notes About Use:

- **Wax Pouring Temperature:** The colder you pour the wax, the more likely the chances of the wax hardening and clogging the spout. Please test the lowest temperature you can pour for your particular wax before clogging issues become apparent.
- **Spout Tip Removal:** In the event wax clogs up the spout tip, it is recommended to remove this by turning it counterclockwise. Some folks like to remove this option.

How to Use Wax Melter

Once assembled, follow the below steps:

1. **Estimate wax:** fill the pot up with the desired amount of wax. If you want to melt as much as possible, pour more wax flakes once it melts down.
2. **Set thermostat:** typically most wax should be heated up around 180 degrees Fahrenheit to prevent wax from burning. However, some folks may wish to start the temperature higher to get it melting quicker, then reduce it once it begins to liquefy.
3. **Place Cover over:** this will help the wax melt quicker and reduce evaporation of your wax.
4. **Turn off & mix in fragrance oil at the temperature specified by your wax or fragrance manufacturer.** You may want to place the cover over after mixing the fragrance in to prevent it from evaporating.
5. **Pour the wax:** simply turn the lever toward you with the candle container under the spout.
